Serverless Computing

DS5110: Big Data Systems

Spring 2025

Lecture 16

Yue Cheng

Some material taken/derived from:

- Berkeley CS 262a (Spring '18) by Ali Ghodsi and Ion Stoica
- Tyler Harter's HotCloud '18 OpenLambda talk

Learning objectives

- Learn the motivation of serverless
- Know the different generations of cloud computing
  - Virtual machines
  - Containers
  - Serverless functions
- Understand current limitations of FaaS

Motivation

When to use the cloud?

- Data
  - Large amounts of data – can't store locally
  - Shared data across users
  - Long-term storage

- Compute
  - Need lots of CPUs for data processing
  - Varying computing demands (resources)
  - No admin (for managing your local hardware)

EC2Instances.info Easy Amazon EC2 Instance Comparison

EC2 RDS

EC2 Instances (724)

Based on your inputs, this is the lowest-cost EC2 instance: **t4g.nano**

Region: US East (N. Virginia) - | Cost: Hourly - | Reserved: 1-year - No Upfront - | Columns - | Compare Selected | Clear Filters | CSV

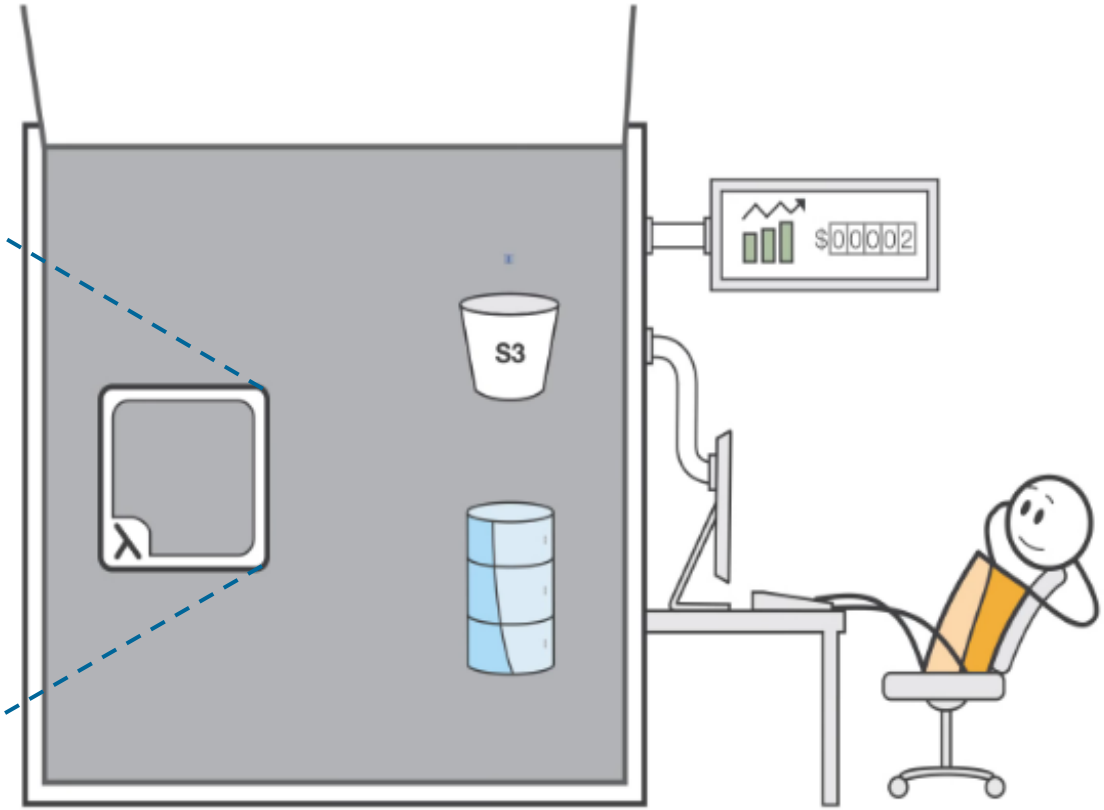
Why is there no “cloud button”?

~~Decision paralysis??~~
Go for Serverless!

Amazon
Lambda

Google Cloud Functions

Microsoft Azure Functions

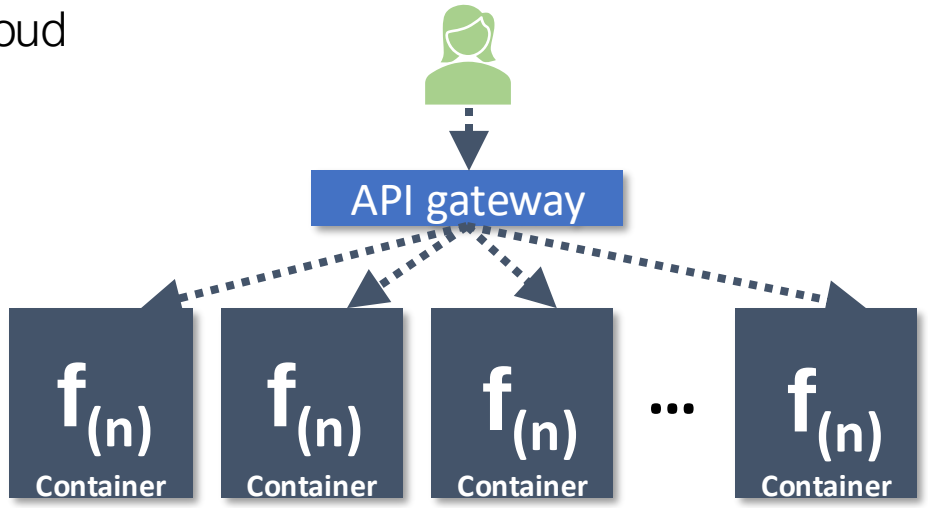


What is serverless computing?

What is serverless computing?

Serverless computing (Function-as-a-Service, or FaaS) is a programming abstraction that enables users to upload programs, run them at (virtually) any scale, and pay only for the resources used

- **Function-as-a-Service (FaaS):** Cloud functions as a basic deployment unit



Function-as-a-Service (FaaS)

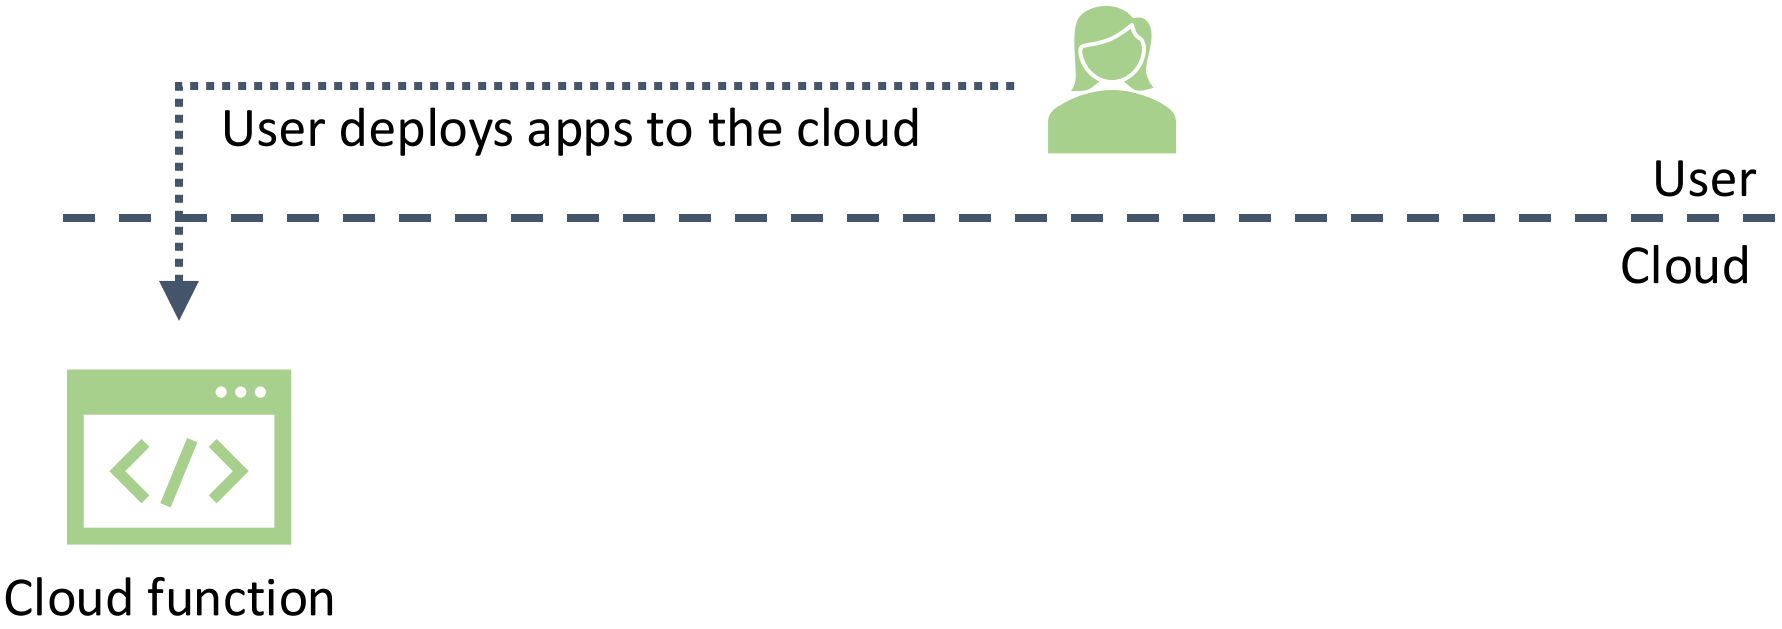
Function-as-a-Service (FaaS)



Function-as-a-Service (FaaS)

FaaS' core capability

1. (Provider) Manage a set of user-defined functions

FaaS' core capability

1. (Provider) Manage a set of user-defined functions
2. Take an event sent over HTTP or received from an event source

FaaS' core capability

1. (Provider) Manage a set of user-defined functions
2. Take an event sent over HTTP or received from an event source
3. Determine function(s) to which to dispatch the event

FaaS' core capability

1. (Provider) Manage a set of user-defined functions
2. Take an event sent over HTTP or received from an event source
3. Determine function(s) to which to dispatch the event
4. Find an existing instance of function or create a new one

FaaS' core capability

1. (Provider) Manage a set of user-defined functions
2. Take an event sent over HTTP or received from an event source
3. Determine function(s) to which to dispatch the event
4. Find an existing instance of function or create a new one
5. Send the event to the function instance

FaaS' core capability

1. (Provider) Manage a set of user-defined functions
2. Take an event sent over HTTP or received from an event source
3. Determine function(s) to which to dispatch the event
4. Find an existing instance of function or create a new one
5. Send the event to the function instance
6. Wait for a response

FaaS' core capability

1. (Provider) Manage a set of user-defined functions
2. Take an event sent over HTTP or received from an event source
3. Determine function(s) to which to dispatch the event
4. Find an existing instance of function or create a new one
5. Send the event to the function instance
6. Wait for a response
7. Gather execution logs
8. Make the response available to the user
9. Stop the function when the execution terminates

AWS Lambda: 1st gen → current gen

- Lambda capacity config keeps **evolving**:
  - 1st gen:
    - ~~300 seconds~~ 900 seconds (15 minutes)
    - ~~single-core~~ ~~two-core~~ → up to 6 cores
    - ~~1.5 GB~~ → 10 GB memory
    - ~~512 MB~~ → up to 10GB of `/tmp` file system
  - Current offering
  - Python, Java, Node.js, Go, …
  - Pricing:
    - Fine-grained billing: 1-millisecond billed duration
    - $0.20 per 1M requests (invocations charge $)
    - $0.0000166667 for every GB-second (compute time charges $$)
    - 6,000 1 GB Lambda functions for one second: 10¢

A car analogy

https://www.slideshare.net/loige/building-a-serverless-company-with-nodejs-react-and-the-serverless-framework-jsday-2017-verona

Concept of serverless is not new

- Google App Engine
  - Fully managed platform as a service (PaaS) for developing and hosting web applications

- Google BigQuery
  - Fully managed data warehouse
  - “Arbitrarily” large data and queries
  - Pay per byte being processed
  - No concept of server or cluster

- AWS S3
  - Fully managed object storage service
  - Pay per byte being stored and written
  - No server maintenance or resource scaling

Desirable properties of FaaS

- Operationally
  - "No-ops" – (almost) no configuration
  - Autoscaling down to 0
  - Closer to pay-per-use (rather than pay-per-allocation)
  - Fine-grained billing

FaaS today

- FaaS is used mostly for simple or coarse-grained tasks
  - Stateless, embarrassingly parallel tasks, simple workflows
    - ETL, software testing, API middleware, image processing, etc.
  - Glue to other serverless backends

- Lots of problems are limiting FaaS' scope
  - Poor performance (vs. time to run actual code) at scale
  - Mismatch of infrastructure support (e.g., today's OS not designed for FaaS)
  - Rule-breaking research needed to reimagine/broaden the scope
  - Very resource-inefficient and costly for serverless providers
  - Lack of support for accelerators
  - …
- **Orders of magnitude slower and inefficient for many "killer" apps**
  - ML inference, microservices, …

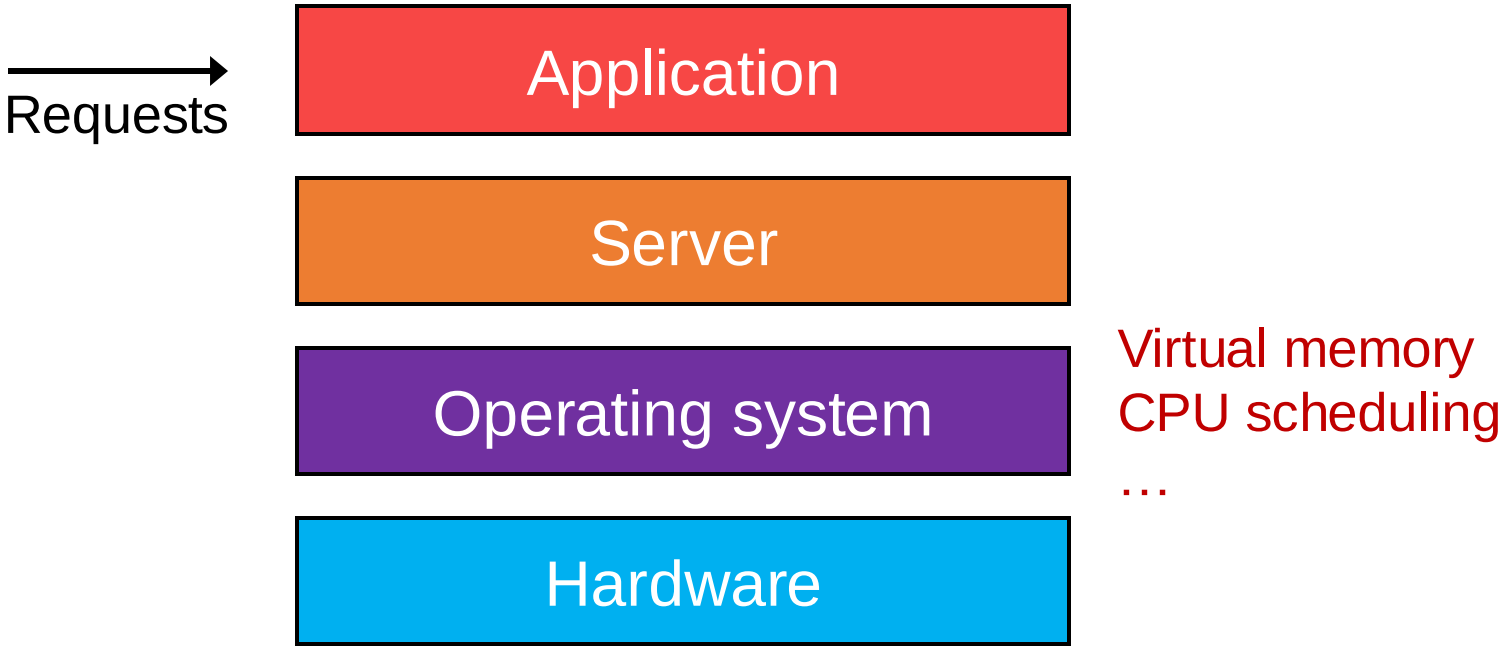
Limitations of FaaS

- **Banned** inbound network
- **No guaranteed** data availability
- Lambdas are **resource-constrained**
- Lambdas have **limited execution time**
- **High cold startup cost** and **invocation cost**

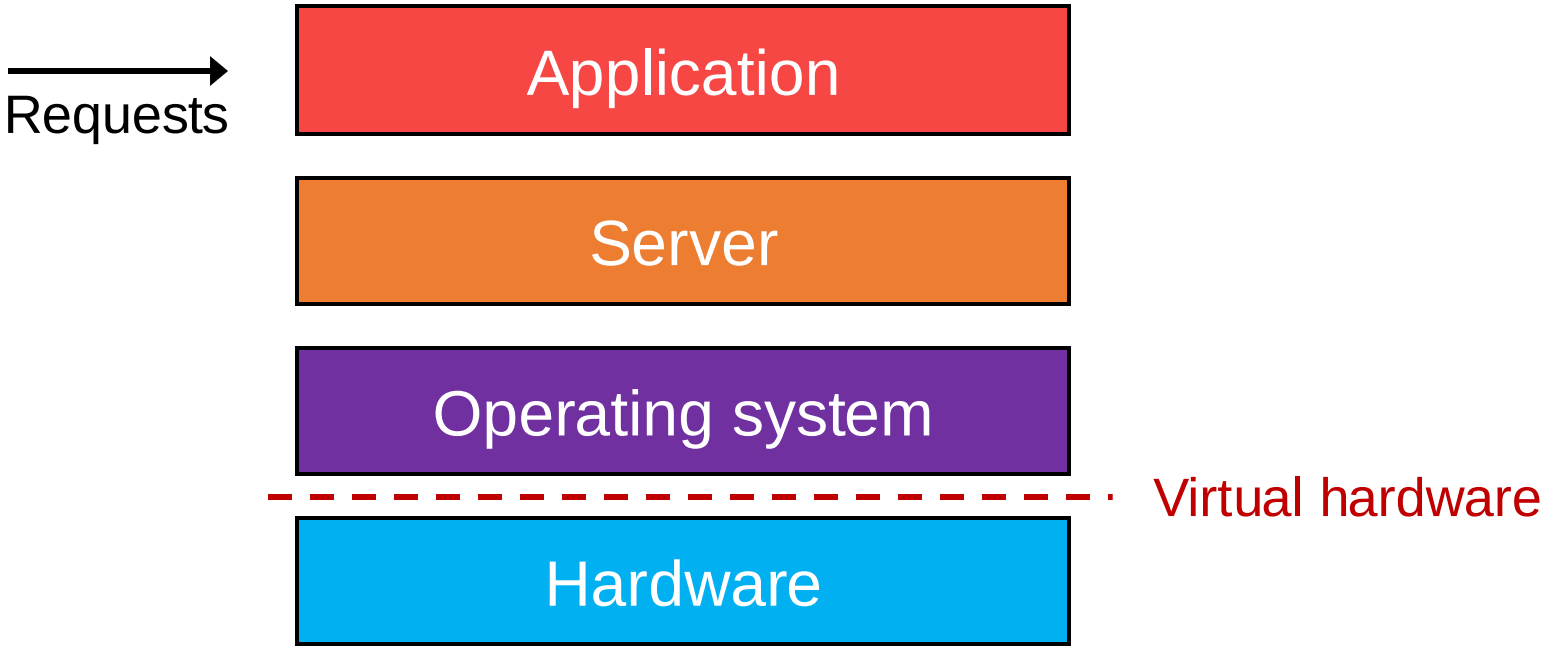
Lambda demo

Cloud evolution history – A virtualization story

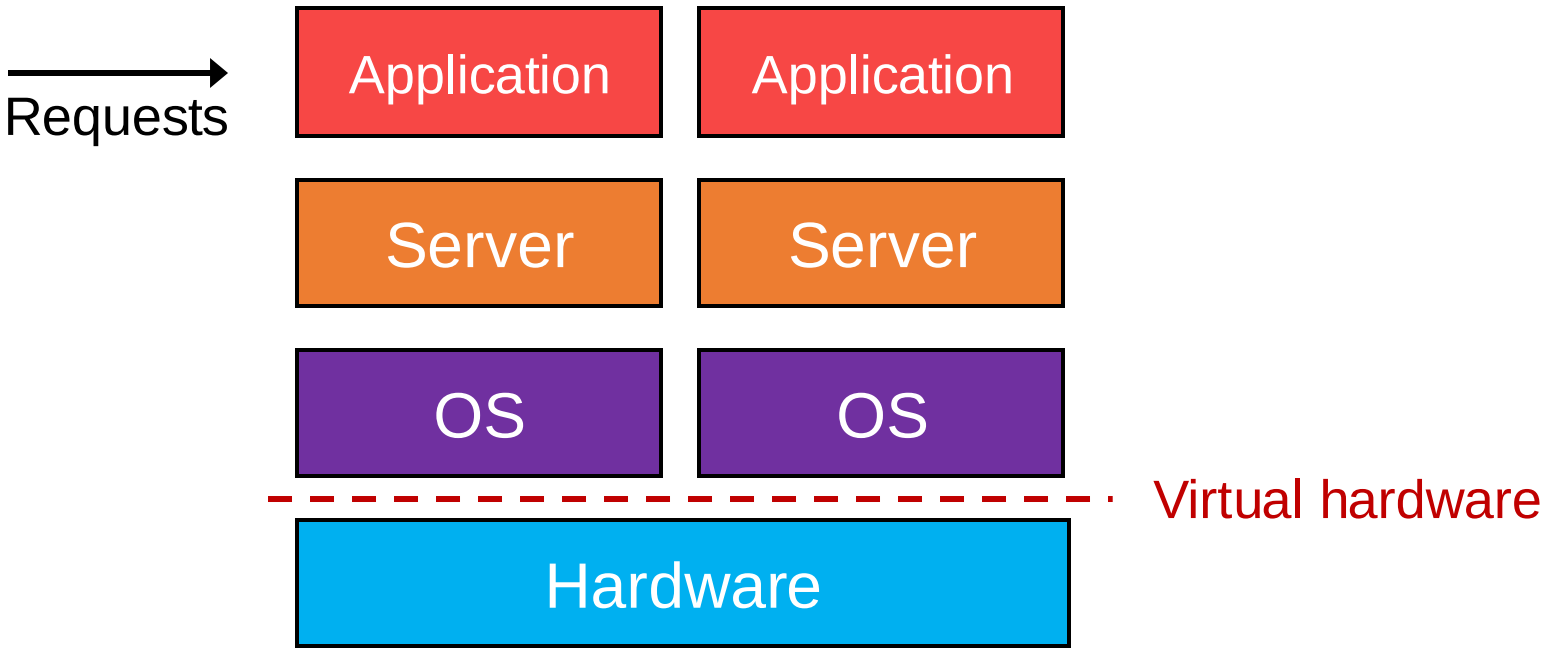
Classic server app stack



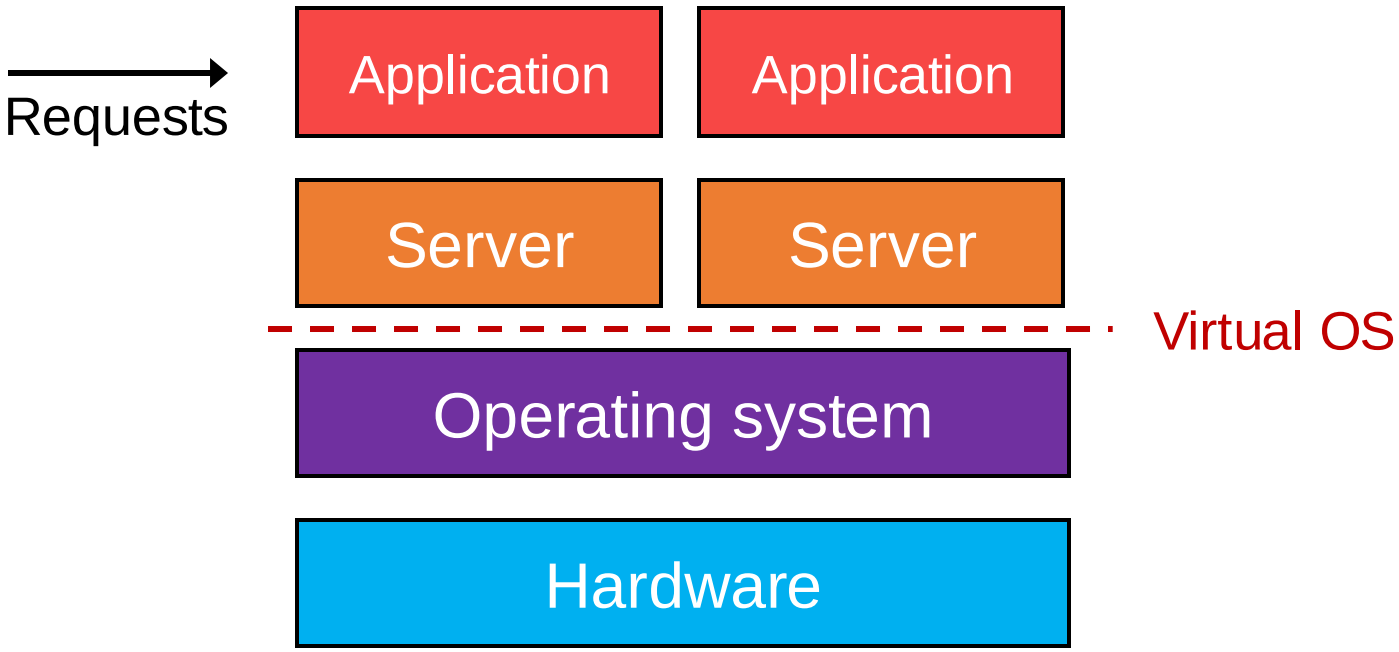
1st generation: virtual machine (VM)



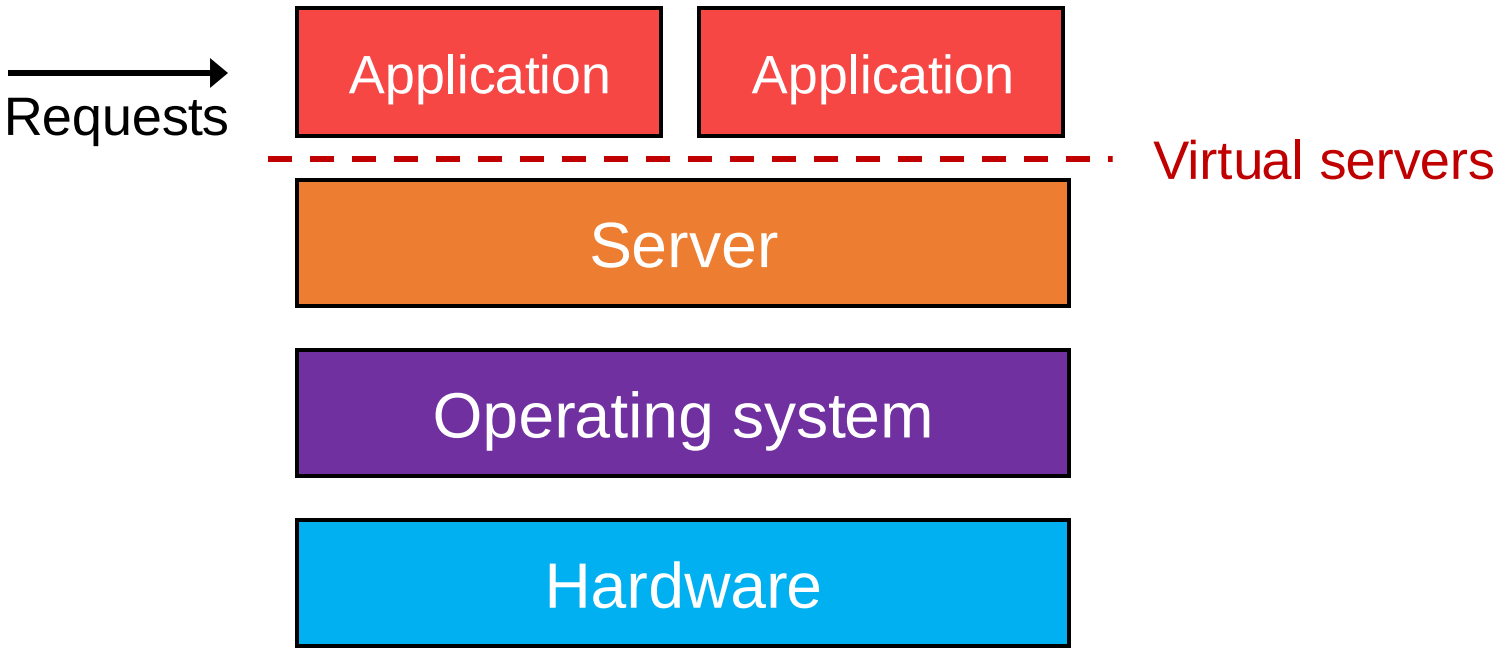
1st generation: virtual machine (VM)



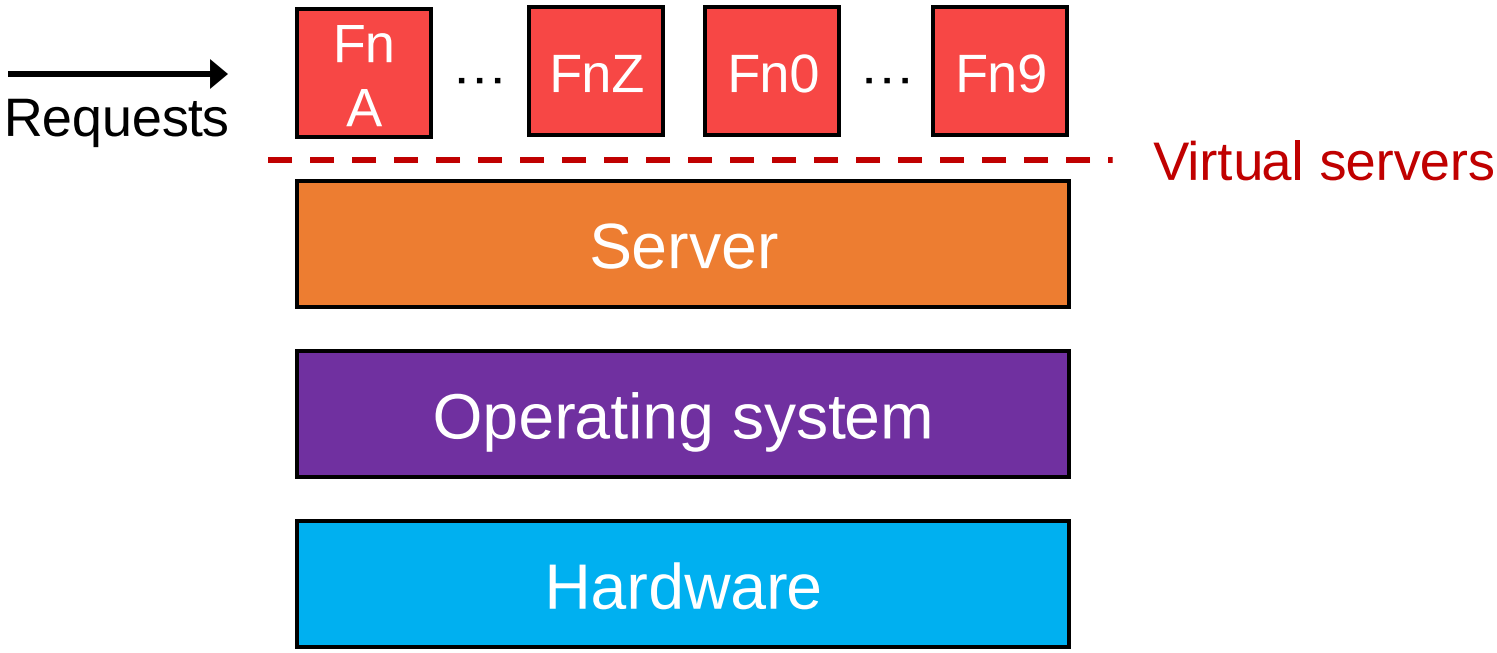
2nd generation: containers



3rd generation: serverless functions



3rd generation: serverless functions



Tradeoff discussion

Serverless functions (AWS Lambdas)

Containers

VMs

Isolation?
